Patent No. 579848

GENERAL INFORMATION

APPLICANT: Caras, Ingrid W.
APPLICANT: Winslow, John W.
TITLE OF INVENTION: AL-1 Neurotrophic Factor
NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:
ADDRESSEE: Genentech, Inc.
STREET: 460 Point San Bruno Blvd
CITY: South San Francisco
STATE: California
Sequence 1, Application US/08442248
Patent No. 5759863
GENERAL INFORMATION:
APPLICANT: Caras, Ingrid W.
APPLICANT: Winslow, John W.
TITLE OF INVENTION: AL-1 Neurotrophic Factor
NUMBER OF SEQUENCES: 18
                                                                                                                                                                                                                                                                         COMPUTER TRADABLE FORM:
MEDIUM TYPE: 5.25 inch, 360 Kb floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                       SOFTWARE: patin (Generated)
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/442,248
FILING DATE: 15-MAY-1995

Submitted (09-MAR-2000) The Institute for Genomic Research, 9712
Medical Center Dr., Rockville, MD 20850, USA
On Dec 17, 1999 this sequence version replaced gi:2583106.
The sequence and annotation of chromosome 2 were merged from those of the individual chones on this chromosome after removing overlaps. For detailed information, please see the TIGR web site (http://www.tigr.org/tdb/at/at.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence and analysis of chromosome 2 of the plant Arabidopsis

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (ftp://arthur.epm.orn.jgov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene (http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu-dk/services/NetGenes/), searches of the complete sequence against a peptide database and plant EST databases at TIGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes without significant peptide similarity but with EST similarity to other proteins are named similarity but with EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRRAscan-SE (sean Eddy, their length are predicted by tRRAscan-SE (sean Eddy, Simple repeats were identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html). Genes are numbered from the top to bottom of the chromosome.
```

We thank the CSHL/WashU/ABI consortium for sequencing BAC clones F6P23, F5J6, T17A5, and T13L16, the ESSA group for sequencing clone F13D4, and Scott Jackson, Jiming Jiang, Klaus Meyer, Eric Richards and Satoshi Tabata for helpful assistance. In addition, we would like to thank the TIGR Bioinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael E. Heaney, Lily Fu, Feng Liang, Jeremy Deterson, Michael Holmes, and Delwood Richardson for software and database support.

This work was supported by the National Science Foundation, Department of Energy and the US Department of Agriculture.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation). Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cosmid is F5110, 1300 bp overlap. Actual start of this is at base position 1 of F6N15; actual end is at 1950 F5110.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MAPPING: Clones were assigned to the YAC map by hybridization by M. Lodhi, Cold Spring Harbor Laboratories, and fingerprinted by M. Marra, WashU, to pick the best candidates for sequencing.

                                                                                                                                                                          The transketolase from tobacco is useful for identifying herbloides for their ability to inhibit the transketolase. The transketolase can be produced in pure form by cloning the gene.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID No:1 to 391 (V52134 to V52524) recorded to nit, or a representative fragment or a sequence at least 95% identical co SEQ ID No: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 prosent invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae CC molecule encoding a homologue of any of the fragments of the S.pneumoniae CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a crose target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members of the library which contain sequences conformable in amplifying nucleic acid molecules whose nucleotide conforms and organism, amplifying nucleic acid molecules whose nucleotide conforms to the sequence of commercial importance, or expression and isolating the amplification primers derived from the conjuter-based system for identifying fragments of the S. pneumoniae genome of commercial importance, or expression modulating craments of the S. pneumoniae genome. Products from the present computerion and vaccines for S. pneumoniae, or expression modulating compositions and vaccines for S. pneumoniae.

Polynucleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-S.aureus vaccines

Claim 1; Page 1267-1268; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access the S.aureus DNA sequences allows putative functions to be assigned to find protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are be used in a vaccine composition against S.aureus infection. The polypeptides can polypeptides can be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformes at the bus syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences homologues of any of the S.aureus DNA sequences computer readable medium.

probable transketolase, and represents a DNA sequence of the invention. The DNA sequences were isolated from Streptococcus pneumoniae strain of the DNA sequences were isolated from Streptococcus pneumoniae strain of 1000993 (WILMB 40794). The Streptococcus pneumoniae strain of 1000993 (WILMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and used to treat diseases caused by S. pneumoniae proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are proteins can also be used to prevent adhesion of bacteria to mammalian capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal

This sequence encodes a Streptococcus pneumoniae protein that is a

can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1685 tetgetgaatataaagaaagtgtgttacetaaagetgtgacaaaacgtgtggegattgaa 1744

pneumoniae

Claim 1; Page 1259-1260; 1409pp; English.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V22134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae of SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) sercenhing a genomic DNA library using as a process comprising: (a) sercenhing a genomic DNA library using as a process comprising: (a) sercenhing a genomic DNA library using as a process comprising to a sercenhing a genomic DNA library using as a process comprising to a process comprising the library which contain sequences in that hybridise to the target sequence and isolating men produced from the members; or (b) isolating men organism, amplifying nucleic acid molecules whose nucleotide contain and organism, amplifying nucleic acid molecules whose nucleotide fragment of the S. pneumoniae genome to prime the amplification and consultar based system for infantifying fragments of the computer readable medium can be consultar and none or an anomal organism and consultar and a computer and the computer readable medium can be consultant and anomal organism and consultant and computer and the computer readable medium can be consultant and anomal organism and S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.

P. aeruginosa detection probe #2. T28491 standard; DNA; 1872 BP 01-APR-1997 (first entry) RESULT T2849.

Detection; probe; amplification primer; bacterial pathogen; pneumonia; Escherichia coli; Klebsiella pneumoniae; Pseudomonas aeruginosa; Proteus mirabilis; Streptococcus pneumoniae; Staphylococcus aureus; Staphylococcus epidermidis; Enterococcus faecalis; respiratory tract; Staphylococcus saprophyticus; Streptococcus pyogenes; urinary tract;

The sequences given in T28490-503 represent probes which were used in the method of the invention for the detection of P. aeruginosa in a sample. The method comprises using probes and/or amplification primers which are specific, ubiquitous and sensitive for determining the presence and/or amount of nucleic acids from selected bacterial species in any sample, where the bacterial nucleic acid comprises a selected target region hybridisable with the probes or primers. The method comprises contacting the sample with the probes or primers and detecting the presence and/or amount of hybridised primers or amplification products as and indication of the presence and/or amount of parts of the presence and/or amount of hybridised primers or amplification products Haemophilus influenzae; Moraxella catarrhalis; septicaemia; meningitis; infection; intra-abdominal infection; skin infection; bacterial resistance; beta-lactam antibiotic; ds. Species. This method may be used to detect commonly encountered bacterial pathogens, e.g. Escherichia coli, Klebsiella pneumoniae, Steudomonsa aeruginosa, Proteus mirabilis, Streptococcus pneumoniae, Staphylococcus aureus, Staphylococcus spidermidis, Enterococcus faecalis, Staphylococcus saprophyticus, Streptococcus pyogenes, Haemophilus influenzae and Moraxella catarrhalis. These bacterial species are associated with approx. 90% of urinary tract infections and with a high percentage of other severe infections including septicaemia, meningitis, pneumonia, intra-abdominal infections, skin infections and other severe respiratory tract infections. The method may also be used to evaluate a bacterial resistance to beta-lactam Method for the detection of bacterial species using probes and primers - allows detection and quantification of antiblotic resistant bacteria in patients, the environment and food Sequence 1872 BP; 402 A; 651 C; 555 G; 264 T; 0 other; Claim 34; Page 71-72; 216pp; English. 95WO-CA00528. 94US-0304732 Bergeron MG, Ouellette M, (BERG/) BERGERON M G.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a DNA of a structural gene coding a heat-resistant isocitrate dehydrogenase (ICD) starting from initiation codon and ending at terminating codon of the 2072 base sequence (240634), where the second codon GCC from the initiation codon ATG is replaced by GCT, GCA or GCG, and/or the ninth codon CCC is replaced by CCT, CCA or CCG. The ICD is useful as a reagent for researches in medical chemistry, blochemistry, agricultural chemistry and pharmacology. The method can prepare a heatresistant ICD in large amount at low cost. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA of a structural gene coding a heat-resistant isocitrate dehydrogenase - useful as a reagent for research in medical chemistry, biochemistry, agricultural chemistry and pharmacology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           123 tgggaactctttgatgagcagtcggatgagtacaaggagaggggcgtcctcctgccgacgtc 182

The reagent is used for the determination of biosubstances in a sample. The reagent can eliminate ammonia in a very short period. The present sequence encodes ICD isolated from Thermus aquaticus.

isocitrate dehydrogense (ICD) starting from initiation codon and ending at terminating codon of the 2872 base sequence (24684), where the second codon GCC from the initiation codon ATG is replaced by GCT, GCA or GCG, useful as a reagent for researches in medical chemistry, biochemistry, biochemistry, agricultural chemistry and pharmacology. The method can prepare a heatresistant ICD in large amount at low cost. The present sequence represents a DNA encoding the heat-resistant ICD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides a DNA of a structural gene coding a heat-resistant

DNA of a structural gene coding a heat-resistant isocitrate dehydrogenase - useful as a reagent for research in medical chemistry, biochemistry, agricultural chemistry and pharmacology
This DNA encodes a heat-resistant (thermostable) isocitrate dehydrogenase. A host transformed with a recombinant vector comprising the thermostable isocitrate dehydrogenase encoding DNA can be used to produce the protein recombinantly. The method can prepare the heat-resistant isocitrate dehydrogenase efficiently.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1392 gagggcaagcccgccacgcttttaagaccagcgagttcggccaggccctgatccagcac 1451

            The invention provides a DNA of a structural gene coding a heat-resistant isocitrate dehydrogenase (ICD) starting from initiation codon and ending at terminating codon of the 2872 base sequence (246834), where the second codon GCC from the initiation codon ATG is replaced by GCT, GCA or GCG, and/or the ninth codon CCC is replaced by CCT, CCA or CCG. The ICD is useful as a reagent for researches in medical chemistry, biochemistry, agricultural chemistry and pharmacology. The method can prepare a heat-resistant ICD in large amount at low cost. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1212 ggcaccgccccaagtacgctggccaggacaaggtgaaccccagcagcgtcatcctctcc 1271

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a solution type reagent for the elimination of ammonia containing a heat-resistant isocitrate dehydrogenase (ICD) showing a high stability at an alkaline pH and responding to both NADP+ and NAD-. The reagent is used for the determination of blosubstances in a sample. The reagent can eliminate ammonia in a very short period. The present sequence encodes ICD isolated from Thermus aquaticus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1212 ggcaccgccccaagtacgctggccaggacaaggtgaaccccagcagcgtcatcctcc 1271

                                                                                                                                                                                                                                                                                                                                                                                                   A DNA sequence (T12068) coding for FLT4 receptor tyrosine kinase (R90528) is used as a probe that specifically binds/hybridizes to DNA encoding human FLT4. Such probes are used to detect FLT4, a novel marker for lymphatic vessels and some high endothelial e.g. in biological tissue for use in diagnosis and therapy of e.g. inflammatory, infectious and immunological diseases, metastatic lymph nodes and lymphangiomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                    Antibodies against FLT4 receptor tyrosine kinase, hybridomas and nucleic acid probes - used to diagnose and treat e.g. metastatic cancers, involving alterations to lymphatic vessels.
                                                                                                                                                                                                     Alitalo K, Kaipainen A, Karnani P, Korhonen J, Matikainen M;

/iste_2: Ecors: Library was prepared by Statagene using the Uni-2AP XR system (Stratagene BN937328-12). Clones were picked by a 0-bot after blue/white selection
/ampfoilin resistance - use 100 micrograms/microliter).
Developed from a pool of equal amounts of RNA from developing embryos sampled at 14, 21, 28 and 35 days after pollination of the Illinois High Oil Maize Strain Cycle 90. This closed strain has been selected for high oil concentration for 90 generations and Originates from the 1890s era open pollinated variety Burr's White"

Clones were picked by a 0-bot after bluew/white selection (ampicillin resistance - use 100 micrograms/microliter). Developed from a pool of equal amounts of RNA from developing embryos sampled at 14, 21, 28 and 35 days after pollination of the Illinois High oil Maize Strain 'vole 90. This closed strain has been selected for high oil 1890s ara pop of generations and originates from the 1890s are applinated variety Burr's White' and 184 g 128 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /tissue_type="embryo"

/germinated and grown aseptically in the dark at room
/ germinated and grown aseptically in the dark at room
/ germinated and grown aseptically in the dark at room
/ cefotaxime in covered crystallization dishes. Five-day
old seedlings were transferred to 5 c cold room and kept
for 48 hr. The tissue, total RNA, and poly(A) RNA were
prepared, a cDNA library was made, and the CDNA clones
were in vivo excised to give pBluescript phagemids in the
TJ Close lab (Choi, close, Fenton) at the University of
California, Riverside. Plasmid DNA preparations and DNA
sequencing were performed in the OD Anderson lab (all
